Mental Health, Dementia and Learning Disabilities

- What you need to know

Standard

9

Awareness of mental health, dementia and learning disabilities

This standard aims to make you aware of the experiences and causes of mental health conditions, dementia and learning disabilities.

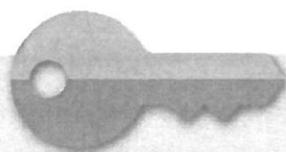

Whilst you may not be working in a role that directly supports these individuals, it is important to have awareness in any health or social care worker role. This is so that any signs and symptoms that you notice are passed on to other workers and that you show compassion and understanding when you experience any behaviour that you find difficult to understand or respond to.

If your organisation provides care and support for individuals with mental health conditions, dementia or learning disabilities, further specialist training should be provided. This will help you to deepen your knowledge and develop your skills and abilities to meet the needs of your role. It may include opportunities to undertake specialist qualifications. Speak to your manager for more information.

Mental health conditions

There are a number of mental health conditions which include psychosis, depression, mood disorder and anxiety. In any year, 1 in 4 adults in Britain will experience at least one mental health need (The Office for National Statistics Psychiatric Morbidity report).

Mental health

Mental health can be seen positively to identify a positive state of mental wellbeing or negatively, to identify a negative state of mental wellbeing, for example, mental health problems or issues.

Depression

Some people think that depression is not a condition and that it will simply go away. This is not true; it is an illness with recognised symptoms but it is treatable. Most people experience feelings of sadness or being down; however living with depression is different. An individual experiencing depression will feel emotions such as hopelessness and negativity that don't go away.

Mild depression

This has a small negative impact on daily living.

Major depression

This has a more significant effect on daily living.

Bi-polar disorder

This causes the individual to experience extreme mood swings from highs, such as joy and excitement, to feelings of complete misery and hopelessness. As a result they may behave in ways others find difficult to understand.

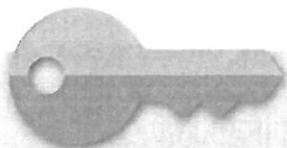

Symptoms of depression can last for a couple of weeks, a number of months or longer. Living with depression can affect how an individual sees themselves. This can lead to them not engaging in a social life, with family or their work. There are treatments available to support people with depression. In some cases, having the opportunity to talk and share how they feel can help. There are various organisations that support individuals who are experiencing depression and provide further information on the condition. One example is the 'Depression Alliance':

www.depressionalliance.org/

Anxiety

Feeling worried or anxious is normal, many people experience things in life that create these feelings. However, those living with anxiety find it difficult to control their worries. As a result they may feel that things are worse than they are. This can create a number of other symptoms including:

- Physical symptoms such as increased heart rate, difficulty breathing and dizziness
- Psychological symptoms such as feeling a loss of control, thinking that you might die or have a heart attack, and feelings of wanting to escape or run away
- Cognitive symptoms such as changes to your thought processes, thinking negative thoughts repeatedly
- Behavioural or social symptoms such as not wanting to leave the house, abusing substances such as alcohol or drugs or behaving in ways that affect your relationships. Individuals may stop going out with friends, or to places such as the supermarket, as they are worried about how they might feel when they are there.

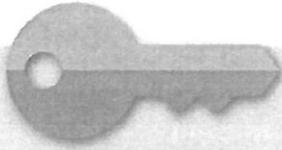

Psychological

Psychological symptoms relate to feelings and emotions, it includes how the mind looks at things and how this can affect behaviour.

Cognitive

Cognitive or cognition refers to our brains and how we think about things; how we process, use and store information we take in through our senses.

There are treatments which help alleviate the symptoms of anxiety such as Cognitive Behavioural Therapy (CBT). This helps someone to talk about their condition and manage the effects by trying to change the way they think.

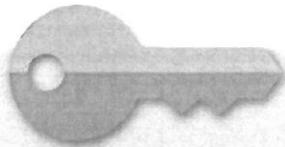

Cognitive behaviour therapy

This is a type of psychotherapy that looks at how you think about yourself, the world and other people.

Psychosis

Psychosis is a symptom of conditions such as schizophrenia and bipolar disorder. NHS Choices say that around 3 in 100 people will have at least one experience of psychosis.

Schizophrenia

This condition can be described as having a break from reality, when it is difficult to understand what is real and what is in their own thoughts. Symptoms could include: hallucinations, delusions and changes in behaviour.

Bipolar disorder

This condition affects a person's moods and means they can go from one extreme mood to another alongside having feelings of depression.

There are two significant signs of psychosis:

Hallucinations - where a person sees or hears things that aren't real but are very real to them. They can also include feeling, smelling or tasting things that aren't real.

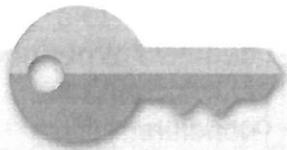

Delusions - where a person believes things that aren't true, for example believing that someone is spying on them.

These experiences can be frightening and lead to behaving in ways that others deem as strange. One way of supporting someone who is experiencing a hallucination or delusion is to embrace what they are saying or doing. Rather than telling them that you can't see or hear what they are seeing or hearing, let them know that you are there to help and that they are safe. This could avoid them feeling you don't believe them and could help ease their stress. Most people who experience psychosis will get better with medication. However, in some cases they may have to be admitted to hospital for treatment and support. If your organisation provides care for people with psychosis, speak to your manager about how individuals' needs are assessed.

An individual may experience a mental health need as a result of:

- A traumatic event, such as an accident, a death in the family or as a result of war
- A chemical imbalance in the brain
- Genetics, for example, a person's additional needs may be due to their DNA.

www.nhs.uk/news/2013/02February/Pages/Five-mental-disorders-genetic-links.aspx

Chemical imbalance

The chemicals or hormones that affect our emotions and behaviour may be lower or higher than they should be.

The mental health problem may last a short time as a result of a specific situation or it may be a condition that they live with for a long period of time.

There are a number of organisations who are working to support people who experience psychosis and can provide further information. These include the 'Mental Health Foundation' and 'Mind'.

You can use their websites to find out more:

www.mentalhealth.org.uk/

www.mind.org.uk/

Dementia

A word used to cover many different conditions that affect the brain. The Alzheimer's Society estimate there are over 100 different conditions that fall under the dementia umbrella.

These conditions cause a decline or reduction in abilities, including:

- Memory
- Thinking
- Reasoning
- Communicating.

Someone who experiences problems with these abilities may feel confused, frustrated and frightened. A common symptom is short term memory loss; the individual finds it difficult to remember recent events or conversations. This can lead to them repeating stories or asking the same question over and over again.

There are a number of different types of dementia which affect individuals differently. The experience of living with dementia is also affected by other people's attitudes and views. The flow diagram below shows how negative views of dementia can cause a negative experience.

If people view living with dementia as a constant loss of abilities...	...that there is nothing that can be done to support the person...	...then the person living with dementia will most likely experience feelings of ill-being...	...that can then contribute to a negative experience of living with the condition.
------------------------------------------------------------------------	--------------------------------------------------------------------	----------------------------------------------------------------------------------------------	------------------------------------------------------------------------------------

There are many causes of dementia. The two most common types are Alzheimer's disease and Vascular Dementia:

In individuals with Alzheimer's disease a bad protein develops in the brain causing damage to the brain cells and their connections.

Vascular dementia is caused by oxygen failing to get to the brain cells as a result of problems with the blood supply (the vascular system).

Whilst the symptoms of each type of dementia are different, all types of dementia are progressive. This means that individuals experience a gradual decline in their thinking, processing and remembering skills. This will vary in each individual and will be affected by the care and support they have.

Dementia is often thought to be a condition that only affects older people; however dementia can affect anyone at any age. In particular, individuals with learning disabilities are more likely to experience dementia at an early age. The Alzheimers Society estimates that there are more than 40,000 people under the age of 65 living with dementia. You can find out more from their website: www.alzheimers.org.uk/

Learning disabilities

Learning disability is a result of brain development being affected before birth, during birth or in a person's childhood. An individual with a learning disability may have difficulty understanding information, learning new skills, communicating and living independently.

The experience of living with a learning disability will vary depending on whether it is mild, moderate or severe. People with a mild learning disability may only need a little support to be independent whilst someone with a severe learning disability may not be able to verbally communicate. Individuals may have other physical and sensory conditions and difficulty responding to feelings and emotions. They may express themselves in ways that others find difficult to understand which can in turn affect how others see and respond to them.

Learning disabilities can develop as a result of a number of causes however this is not always known. Causes can include:

- Genetic conditions such as Down’s Syndrome which happens as a result of an extra chromosome. This leads to impairments in both cognitive ability and physical growth that range from mild to moderate developmental disabilities
- Complications during birth which can lead to lack of oxygen
- Illness or injury in childhood which has affected the brain such as meningitis.

In most cases living with a learning disability will have a lifelong impact but this will vary depending on the type of learning disability.

Mistaking conditions

Psychosis	Depression/ Mood disorders	Anxiety	Dementia	Learning Disabilities
Confusion as a result of hallucinations and delusions - Lack of insight and self-awareness - Problems with sleeping.	- Change in mood/personality - Problems with sleeping.	- Change in mood/personality - Problems with sleeping.	- Confusion as a result of memory loss - Change in mood/personality - Problems with verbal communication - Problems with sleeping.	- Confusion due to difficulties with memory or relating to information - Lack of insight and self-awareness - Problems with verbal communication.

Self-awareness

This means having an understanding of you, your feelings, emotions and behaviours and understanding how your feelings, emotions and behaviours can affect others.

Care and support

As each individual is unique with a different personality, life history and experience, care and support should build on an individual's particular skills and abilities. The experience of living with any of these conditions will be affected by the type of support someone receives. For example, if an individual with a learning disability is supported to use and develop their abilities they will become more independent.

Promoting positive attitudes

There is a lot of stigma linked to living with a mental health need, dementia or learning disability. This can create feelings of loneliness or being left out in society. However, through focusing on the abilities and skills someone has, living with the condition can be positive and people can be supported to live well. It is important that you demonstrate a positive attitude towards all those living with mental health needs, dementia and learning disabilities. You can do this by:

- Helping to reduce the stigma by making sure individuals are not isolated in social situations
- Promoting wellbeing for those living with the condition
- Identifying and building on skills and abilities the individual has
- Providing opportunities for individuals to feel empowered and in control.

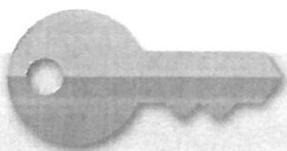

The social model of disability, positive attitudes and person centred practice

The social model of disability says that disability is caused by the way society is organised, rather than by a person's impairment or difference. This is a different to the 'medical model' of disability which focuses on treating or trying to cure an illness. The social model looks for ways of removing barriers that limit life choices. When barriers are removed, people can work towards being as independent as they can be and be included and equal in society.

These barriers could include:

- The environment, for example, is a building accessible for a person who uses a wheelchair?
- The impact of people's attitudes, for example, stereotyping all people with dementia as the same and assuming they will all be affected in the same way
- The impact of an organisation's approach, for example, ways of working that are set to meet the needs of the organisation rather than the individual.

Accessible

Can the individual gain access or entry to a part of the environment for example, a building, a room or a specific service.

Stereotyping

To stereotype means to use labels that identify an aspect of a person or group, for example their age, sexual orientation, ability or gender then using this label to make an assumption about them or the group they belong to. For example – all older people are deaf; which is a stereotype based on an assumption that as you get older you are likely to lose your ability to hear.

The social model puts the focus on the individual and their unique needs and not on their condition. This person centred approach helps develop positive attitudes in society.

Adaptations

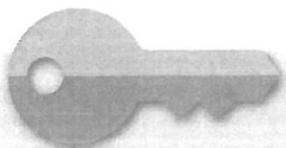

Health and social care organisations usually need to work together to provide for care and support needs. For example, there may need to be an Occupational Therapy assessment to find out how a person manages their day-to-day life and any adaptations that might be needed. This might result in providing adaptations such as adding handrails for support in the bathroom.

Emotional support may need to be considered for both the person living with the condition and their family or carers. This might involve arranging a befriender or a counselling service.

Practical information or additional services about an individual's condition, illness, financial and legal issues and opportunities to plan ahead should also be available. Forums, charities, helplines or support groups are all useful sources of support and information.

Reporting concerns

If you think that someone is developing symptoms of a mental health problem or of dementia, or if you think that the support needs associated with their learning disability need reassessing, you should record this information and pass it on. Who you inform and how will depend on your workplace and your role. There may be other workers involved so it is important to follow your agreed ways of working on recording to reduce lost or misinterpreted information

Agreed ways of working

This refers to organisational policies and procedures. This includes those less formally documented by individual employers and the self-employed as well as formal policies such as the Dignity Code and Compassion in Practice.

When recording information there are a number of points to consider:

- Ensure the information is accurate
- It should be clear, concise, and legible
- It should be non-ambiguous and state facts not opinions or assumptions
- The person involved should be given the opportunity to contribute
- Apply the principles of the Data Protection Act and maintain confidentiality.

The importance of early detection and diagnosis

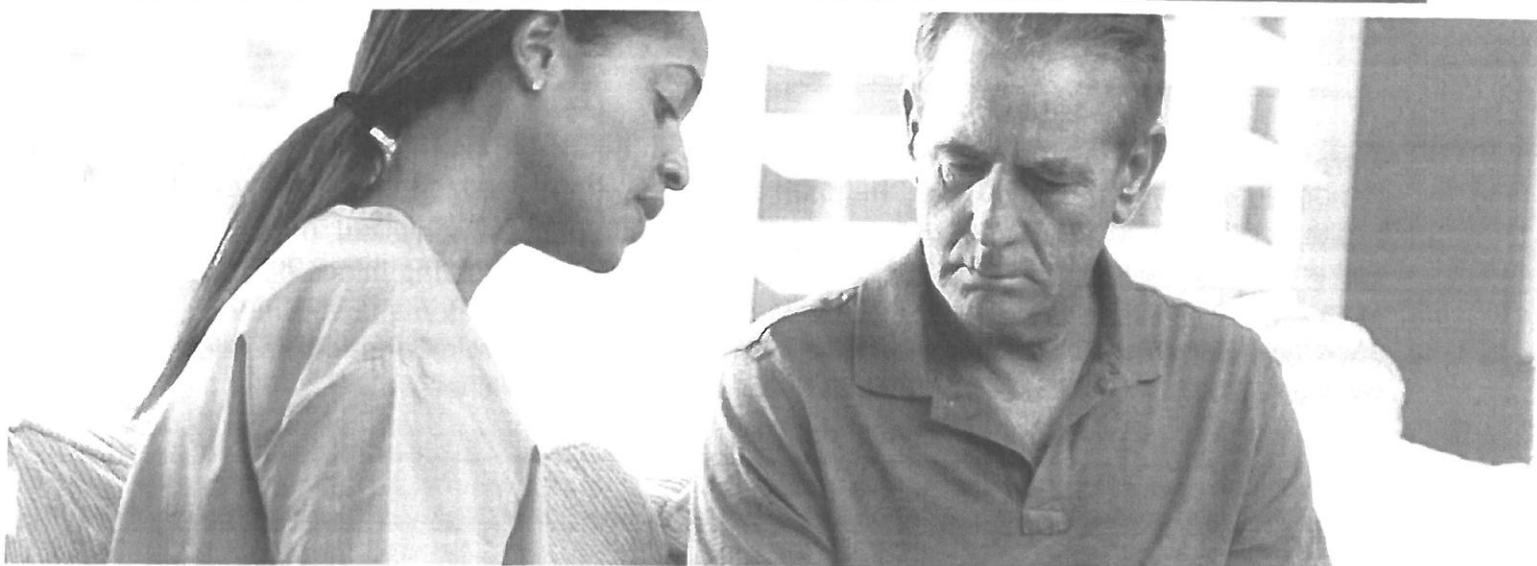

An early diagnosis benefits the individual and their family and friends. It can support them to put steps in place to maximise their quality of life. The diagnosis will:

Clear up uncertainty. It can be upsetting living with symptoms like memory loss and changes in personality, particularly if you don't understand why they are happening. As there are a number of conditions that have similar symptoms it is important that an accurate diagnosis is made. Whilst this can be difficult to hear it can clear up uncertainty and help someone to feel more in control.

Help the individual and their family and friends to plan. Planning for the future provides the opportunity to consider, discuss and record wishes and decisions. This is known as advance care planning; the individual makes plans about what they wish to happen while they are most able to be involved and make decisions.

Identify possible treatments and therapies. An individual may want to consider taking medication such as anti-dementia drugs or anti-depressants. They may also benefit from therapies such as counselling or cognitive behaviour therapy.

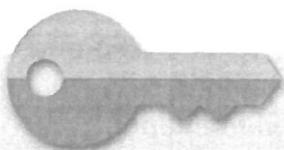

Provide the right information, resources and support. Through accessing information at an early stage someone can make best use of what is available such as support groups. They can also identify financial support that they may be entitled to.

Adapting care and support

If an individual is diagnosed as living with a mental health need, dementia or learning disability, they are likely to need changes to how care and support is provided over time. This will ensure that care and support continues to be person centred.

Changes may mean that workers need to develop skills to support people who find it difficult to verbally communicate for example, learning Makaton. They may also need to learn how to use assistive technology like clocks and calendars, reminder messages or locator devices. Of course, the individuals themselves also need support to learn how to use this technology.

Makaton

This is a form of language that uses a large collection of signs and symbols to support and encourage communication.

Those living with mental health needs, dementia or a learning disability are more vulnerable to abuse. You should follow your agreed ways of working to make sure each individual is best protected from harm or abuse.

Legal frameworks, policy and guidelines

Legislation and a number of policies have been developed to promote human rights, inclusion, equal life chances and citizenship of individuals with mental health needs, dementia or learning disabilities. These include:

Human Rights Act 1998 – This identifies the fundamental rights and freedoms that all individuals have access to in the UK. It ensures that those with mental health needs, dementia or learning disabilities are also treated fairly and with respect.
www.legislation.gov.uk/ukpga/1998/42/contents

Care Act 2014 – This puts a general duty on local authorities to promote the wellbeing of individuals. The Act makes sure that care and support provided to those with mental health needs, dementia and learning disabilities provides for their physical, mental and emotional wellbeing. It puts the focus on prevention and ensuring things don't get worse for an individual; providing information to ensure people can make informed decisions and ensuring there are a range of services available to meet people's needs.
www.gov.uk/government/publications/care-act-2014-part-1-factsheets

Data Protection Act 1998 – This ensures that public bodies maintain the protection of data. The Data Protection Act makes sure that personal data held by organisations is kept confidential, not kept longer than necessary and is accurate. This includes data about an individual's health or condition. The Act gives individuals the right to see the data and information held about them.
www.gov.uk/data-protection/the-data-protection-act

Safeguarding Adults National Framework – Safeguarding adults is about promoting people's welfare and keeping them safe from harm and abuse. Individuals living with a mental health need, dementia and learning disability are particularly vulnerable and therefore services need to ensure they are working to maintain their safety.
www.adass.org.uk/adassmedia/stories/Publications/Guidance/safeguarding.pdf

Fundamental Standards of Quality and Safety – A guide developed by the Care Quality Commission (CQC) that describes the fundamental standards of quality and safety that people using health and social care services can expect.

Mental capacity

Mental capacity is a term used to describe an individual who has the ability to make their own decisions. Having mental capacity means that they are able to understand information and make an informed decision or choice.

All individuals have the right to make their own decisions. However, sometimes it is assumed that because they have a condition that can affect their cognitive abilities they are no longer able to make their own decisions. By assuming a person has capacity, opportunities can be provided that enable the person to make their own decisions which helps them to feel empowered, confident and in control.

'Advance statements' ensure that an individual's wishes are taken into account in the future. This is often referred to as 'advance care planning'. The purpose is to enable an individual to make choices and decisions about their future care and support in case there is a time when they are unable to make these decisions for themselves, for example in the later stages of dementia. This can ensure that an individual is not given any care or treatment that they do not wish to receive but will receive the care they wish to have.

Many employers will provide further training, guidance and/or supervision to help health and social care workers understand mental capacity issues. Speak with your manager about opportunities to learn more about this important area.

Making an assessment of capacity

There are two specific questions that can help in assessing a person's capacity, they are:

1. Does the person have an impairment, or a disturbance in the functioning, of their mind or brain? This can include, for example, conditions associated with mental illness, concussion, or symptoms of drug or alcohol abuse.

If so,

2. Does the impairment or disturbance mean that the person is unable to make a specific decision when they need to? You should offer appropriate and practical support to achieve this before applying this stage of the test.

The Mental Capacity Act 2005 states that a person is unable to make their own decisions if they are unable to do one or more of the following:

- Understand information given to them
- Retain information long enough to be able to make the decision
- Weigh up the information available to make the decision
- Communicate their decision – this can be through verbal communication or by using sign language or simply blinking an eye.

It is essential that the individual is supported to find ways of communicating before a decision about their capacity is made. This might involve family, friends, carers and other workers. An assessment should be made based on the balance of probabilities. For example, is it more likely than not that the person lacks capacity?

There are five key principles that everyone must follow when assessing capacity, these are:

- Always assume that the person can make their own decision
- Ensure all possible support is provided to make sure the person can make their own decision
- Do not assume someone cannot make a decision because you feel they are making an unwise or unsafe decision
- If it has been identified that the person cannot make a decision, someone can make a decision that is deemed to be in that person's best interest
- If a person makes a decision on behalf of the individual, this must be the least restrictive option.

If you are supporting a person who is struggling to make decisions, it is important that you apply the five key principles.

An assessment of capacity may need to be made when a person is unable to make a particular decision at a specific time. The Mental Capacity Act 2005 applies to supporting an individual to make both day-to-day decisions (for example what to eat) and complex choices such as around care and support or managing finances. A Mental Capacity assessment is decision-specific and the principles must be applied to individual decisions. It is important to remember that an individual may lack the capacity to make a specific decision, such as around their finances, but this does not mean that they lack capacity to make all decisions.
